ABSTRACT

This research applied exploratory factor analysis, confirmatory factor analysis and structural equation modeling to investigate the experience marketing philosophy on service providers within the context of Bangladeshi consumers'. The findings confirmed that there is a strong relationship between brand images towards experience marketing when physical context of a firm plays a mediating role. This research opens up opportunities for managers to identify significant factors those are linked towards building experience marketing.

Keywords: Firms Commitment; Brand Image; Customers' Satisfaction; Physical Context; Service Industries

INTRODUCTION

Customer-employee interaction is essential for any service or product-based firm. Indeed, no systematic review of the literature on the concept of experience marketing has yet been published under a developing country's consumers' perspective (Mitchell, 1998; Pine and Gilmore, 1997). This study not only revealed the significant factors of experience marketing but also it provides a greater degree of guidelines for academicians and managers in developing better marketing strategies for the service oriented companies in Bangladesh.

REVIEW OF LITERATURE

Experience can be an individual, a community, a nation, or even humankind as a whole that can be defined as a new idea that changes the way marketers think about their brands (Mitchell, 1998; Helkkula, 2010). Pine and Gilmore (1997) argued that goods and services were no longer enough to compete in today's increasingly commoditized world and companies had to move beyond goods and services to stage experiences and guide transformations. In other research they also applied the theme of experience economy in different industry (Pine and Gilmore, 2001; Williams, 2006, Rahman et al. 2012).

Firm's Commitment and Experience Marketing

Commitment is a valued relationship with maximum effort being expended and as a result there will be sustainable forward-looking by both party in future (Morgan and Hunt 1994; Gustafsson *et al.* 2005). In marketing literature, commitment has two distinct natures; affective and calculative. Effective commitment focuses on psychological attachment to a service provider and calculative commitment emphasizes on switching costs (Gundlach *et al.* 1995; Bansal *et al.* 2004). A significant amount of literature suggested that a firm's commitment has a huge effect on building experience marketing in various ways (Brown *et al.* 2005; Verhoef *et al.* 2002; Fullerton, 2005). Thus, based on the above literature it is hypothesized that:

H1: There is a strong relationship between a firm's commitments towards implementation of experience marketing where customer's satisfaction play as a mediating role.

Brand Image and Experience Marketing

The brand associations (value-proposition; emotional or self –expressive) can be tangible or emotional or symbolic or both (Hulten, 2009; Anselm and Kosteljik, 2008; Ratneshwar and Mick, 2005). According to Hulten (2009), from emotional perspective, most of the enterprises are focusing more on tangibles. This includes the physical and relational characteristics (Gupta and Vajic, 1999). In the physical context example of stimulators are created by the sights, sounds, textures, and smells of the environment and, in the relational context, stimulators emanate from people and their behavior (Carbone and Haeckel, 1994). Even though in brand and customers experience context little attention has been given to understand the creation of a brand as an image (Payne *et al.* 2009). Thus based on the above literature it is hypothesized that:

H2: There is a strong relationship between brand images towards implementation of experience marketing where enhancement of physical context play as a mediating role.

Conceptual Framework:

The entire research rests on the basis of the theoretical framework. Based on the previous literature reviews; this research concentrates on conceptual framework of factors that help. The detailed diagram framework is given below through Figure 1.1:

Figure 1.1: Conceptual Framework

METHODOLOGY

To accomplish research objective, this study employed a four-step methodology. First, from a review various scholars' articles, this research generated 24 items in fact each variable consisted with five items that were measured with each latent variable (Firm's Commitment; Brand Image; Customer's Satisfaction; Physical Context; Experience Marketing). This research were employed a survey via convenient sampling procedure by using shopping mall intercept at significant places in Dhaka. A total of 300 individuals responded response were collected through the mall intercept under the category of consumer of electronics, hairdressing and beauty salons, restaurants consumers'.

Data Analysis Procedure

The data analysis of this study was organized into four stages, as shown in using the descriptive and inferential statistics techniques. The first stage of the data analysis used means, frequency, and percentages to represent the respondent's overall demographic profile. The second stage of the data analysis used the exploratory factor analysis (EFA) to identify the factor structure and check the validity and the reliability of the scale. In the third phase of the data analysis, this research employed confirmatory factor analysis (Gerbing and Anderson, 1988) and structural equation modeling to test the hypothesis. This research used chi-square statistic/degree of freedom as well as model fit indices such as comparative fit index, non-normed fit index, and root-mean-square residual were examined to evaluate the adequate fit of models (Bentler, 1990; Bentler and Bonett, 1980; Tucker and Lewis, 1983; Nevitt and Hancock, 2000).

RESEARCH RESULTS

Descriptive Analysis Results of Survey and Respondent's Profile

Among the 300 respondents, 50 did not fill out the questionnaires completely. This result yielded 250 usable questionnaires which resulted in an 85% adjusted response rate. Among the 250 respondents there were more male respondents (60.0%) than female respondents (40.0%). The majority of respondents were between 20 to 29 years old (70%) and the second largest were between 30 to 39 years old (25%). Most of the respondents worked at service-oriented company (50%), whereas 30% of the respondents worked at manufacturing-oriented companies. In addition, 80 percent of the respondents reported that they cared for companies who deliver products with good experience whereas 20 percent of the respondents were not even aware about experience marketing.

Exploratory Factor Analysis (EFA)

To assess the validity and reliability of each construct, factor analysis and reliability testing were used. After factor analysis using the varimax rotation 16 items were kept for further analysis (Firm's Commitment-4; Brand Image -4; Customer's Satisfaction -4; Physical Context-4). To test the appropriateness of factor analysis, the Kaiser-Meyer-Olkin (KMO) overall measure of sampling adequacy (MSA) was calculated as 0.82 (Table 1) which is meritorious (Kaiser, 1974). In addition, the communalities range from 0.57 to 0.92 with an average value above 0.70, suggesting that the variance of the original values were fairly explained by the common factors. Four stable factors were derived from the analysis (Table 1)

Table 1: Summary of Exploratory Factor Analysis

Factor Name	EV1	PV2	CV3	Component Variables	Factor Loading
Firm's Commitment Chronbach Alpha = .74	2.792	8.217	21.223	Affordable for middle income group	.779
				Financial access to purchase	.771
				Positive Feelings	.666
				Delivery of services	.671
Brand Image Chronbach Alpha = .83	1.693	7.600	29.013	Image building Program	.612
				Service dependably	.678
				Security and privacy	.678
				Customer acquisition Promotion	.671
Customers Satisfaction Chronbach Alpha = .75	1.545	6.101	41.269	Ability of flexibility and dynamic	.679
				Community support	.678
				Location convenience	.618
				Priori expectations	.688
Physical Context Chronbach Alpha = .83	1.545	7.101	43.869	Technology intensity	.779
				Internal Atmosphere	.678
				Voice and music in the atmosphere	.718
				Exterior and interior design	.688

Notes: 1: Eigenvalue (EV1) 2: Percent of Variance (PV2) 3: Cumulative Variance (CV3)

In this research, content validity deals with "how representative and comprehensive the items were in creating by the scale" (Bohrnstedt, 1970). This research assessed them by examining the process by which scale items were generated (Straub, 1989). In this study, definitions of the constructs were proposed based on the literature review. In the SEM (Structural Equation Method) method, construct validity was viewed as hypothesis testing in which specific relations were posited and tested which were applied in this study (Hancock and Freeman, 2001). In order to demonstrate convergent validity, items that measure the same trait should correlate highly with one another if they are valid measures of the concept. To make composite measures of the constructs, the summated mean scales were calculated in this research (Hair et al., 1998).

Confirmatory Factor Analysis and Structural Equation Modeling

To confirm the factor, this research was conducted confirmatory factor analysis. Results from the CFA using AMOS software were summarized in Table 2. The fit indices demonstrated good fit of the measurement models to the data. The full model was tested based on the measurement model previously validated from CFA in the study. The fit indices of the full model were $\chi^2/df = 2.65$ ($\chi^2 = 3577.133$, $df = 1348$); GFI = .921; AGFI = .915; RMSEA = .051; CFI = .913; NFI = .924. To assess the mediating effects towards of experience marketing under the customers' perspective this research examined the predictive validity of the hypothesized model using decomposition of effects through Mplus. As predicted it was observed that there was a strong relationship between brand images towards implementation of experience marketing where enhancement of physical context played a mediating role supporting H2 (See Table: 2). The results also showed that there is a moderate relationship between firm's commitment towards experience marketing when customers' satisfactions play as a mediating role supporting nearly H3 (See Table 2).

Table 2: The estimates of the mentioned variable

Path Direction	Estimates (Estimate of regression weight)	S.E(Standard error of regression weight)	C.R (Critical ratio for regression weight)	P (Level of significance for regression weight)
Customers' satisfaction ← Firms' Commitment	.395	.070	7.364	.003
Physical Context ← Brand Image	.685	.060	8.949	.000
Experience marketing ← Customers' Satisfaction	.280	.043	6.269	.002
Experience marketing ← Physical Context	.485	.043	3.701	.000

CONCLUSIONS

More precisely, the findings suggested that there is a strong relationship between brand images (BI) towards experience marketing (EM) when physical context of a firm (PC) plays a mediating role. Besides that, the result also confirms that a firm's commitment (FC) has moderate relationship with experience marketing (EM) when customer's satisfaction plays a mediating role. It is evident that staging experience can act as a source of core competency for a business in strengthening its brand recognition, building company image, and providing unique feature to the consumers in the bundle of offering. Managers are suggested to develop a more 'personal' and unique one-on-one connection with customers. The most significant limitations of this research are the cross-sectional and self-reported data. The use of such data may have led to the overestimation of the relationships. Secondly, this study took place within a specific geographic area (Dhaka city). As a result, the findings of this study may not be generalized to other countries. Future research should aim to obtain larger sample size in other countries to reach comparative results
